Production of rat gastric fundus samples:

Immediately after sacrificing the SD rat by striking the back of the head and exsanguinating, laparotomy was performed and the lower part of the oesophagus and the upper part of the duodenum were each cut with scissors and it was removed, and immersed in prepared nutrient solution. The front of the stomach was cut free and cut

open vertically along a small curve, and scissor holes were introduced into the gastric fundus muscle pieces alternately at 3mm width, and this was cut further into lengths of 3 mm.

**Magnus apparatus and measurement:**

Sample was suspended in a Magnus tube containing 20 ml of tyrode solution, and a 1 g load was applied, and a set isotonic contraction was observed in acetylcholine  $10^{-5}$ M, and it was washed, and after about 20 minutes, isotonic contraction (A) of leukotriene  $C_4$   $10^{-8}$ M was recorded as control contraction. Moreover, it was washed, and after about 30 minutes, test material was added, and after 10 minutes, leukotriene  $C_4$   $10^{-8}$ M was added and its isotonic contraction (B) was recorded.

**Determination of activity:**

$$\text{Inhibition rate (\%)} = (1-B/A) \times 100$$

**Leukotriene  $D_4$  antagonism test**

Reagent: Leukotriene  $D_4$  (Wako Pure Chemical Industries)

The guinea pigs were exsanguinated and laparotomised, and the ileum removed and its contents were washed and near 10 cm from near the caecum was removed, and suspended as a tubular sample of about 2 cm in a Magnus tube containing tyrode nutrient liquid at 32 °C with 95%  $O_2$  5%  $CO_2$  flowing through, and a 1 g load was applied.

**Magnus apparatus and measurement:**

After suspending the extracted sample, about every 20 minutes, and the Magnus tube was filled with nutrient liquid 20 ml at 32 °C with 95%  $O_2$  5%  $CO_2$  flowing through. A measurement record was observed of isotonic contraction in histamine solution  $10^{-5}$ M

two times per set, it was washed, and after a further 20 minutes, as a control contraction, isotonic contraction (A) of leukotriene D<sub>4</sub> 10<sup>-8</sup>M was recorded. Furthermore, about 30 minutes after washing, test material was added, and after 10 minutes, leukotriene D<sub>4</sub> 10<sup>-8</sup>M was added and its isotonic contraction (B) was recorded.

RBL1 cultured cells were suspended in 50 mM phosphate buffer (pH7.4) containing 10% ethylene glycol and 1 mM ethylene diamine tetraacetic acid (EDTA), so as to have 5 x 10<sup>6</sup> cells/ml, and subjected to ultrasound, then centrifugally separated at 10,000 x G for 10 minutes and 105,000 x G for a further 60 minutes, and the supernatant was taken as the 5-lipoxygenase enzyme sample.

(0105)

10 μM arachidonic acid as substrate, the enzyme sample obtained as above, and a DMSO solution of the compound obtained in the Examples, made to have final concentration 10 μM, were taken into a test tube and made to react for 10 minutes at 37 °C. Butyl 3,5-dinitrobenzoate 10 μl of 0.25M was added as an internal standard, and extraction with 1.8 ml of hexane was performed. The quantity of 5-HETE in this was measured by high-performance liquid chromatography [column, TSKgel ODS-80TM (TOYO SODA) with mobile phase of acetonitrile: water: ethyl acetate = 60:40:0.02, flow rate 1 ml/min, detection, UV (235 nm)].

(0106)

From the results, the 5-lipoxygenase inhibition rate was calculated according to the following formula

$$\text{Inhibition rate} = \{(C-S)/C\} \times 100 (\%)$$

C: 5-HETE peak area when compound obtained in an Example was not included (corrected using internal standard)

S: 5-HETE peak area when compound obtained in an Example was included (corrected using internal standard)
